

Fired Heater Scan 360°

Inspection for wall loss, pitting & crack detection

The Fired Heater Scan 360 inspects from one accessible side of the tube to perform a complete circumferential scan that uses our proprietary technology to inspect carbon, stainless, chrome molly, and Inconel materials.

Our inspection system has many advantages for working in the heaters as we do not require any liquids that could either fall on the floor of the refractory or burners. We can detect ID wall loss, cracking and pitting at high speeds on either Horizontal, Coils or Vertical tubes.

The Key Benefits:

- Lightweight portable
- No couplant needed
- 100% coverage
- Accurate and fast inspection
- Inspection during shutdowns
- Repeatable results so additional measurements can be taken to ensure results accuracy
